Do learning styles matter when learning? In my opinion its a yes and no. Learning styles vary from person to person and teacher too teacher. Some students might get more out of a specific learning style than other students. For example, my best learning style is face to face, due to me retaining more information from those face to face interactions. While on the other hand, a friend of mine is the complete opposite of me, he likes the online classes more than the in person ones. Another example is when I learn math, my most recent math teacher's learning style was experiment on the answers, while that is a good learning method for some, it was not at all for me. I was always taught math in a way where we watch the teacher do the math first and carry on from there. So in a sense yes learning style matters but no at the same time due to it not completely limiting your learning ability. There are also many different types of learning, none being static, for example there is visual, auditory, and hands on learning. Its solely based on what the person learning feels comfortable with.
